

SystemOne Medicines Management Team (MMT) Formulary

The Sheffield CCG MMT Formulary contains Sheffield Formulary recommended products in addition to cost effective formulations or brands e.g. Neditol XL, which is a cost effective brand of Tolterodine modified-release; and provides important safety information for specific drugs.

To ensure that the products recommended in the MMT Formulary are preferentially displayed **each SystemOne user** has to ensure that they have the **'Formulary entries'** box ticked within the drug and appliance browser. The example below shows that when entering Tolterodine, the products listed at the top is Neditol XL.

This is a **user specific setting** and therefore **each individual user** needs to **amend their own settings**. In theory once you have set this option up this should be your default setting. However, there have been occasions where the 'Formulary entries' box has become unticked so the 'Formulary entries' tab will need resetting.

The example below shows that the **'Formulary entries'** box is not ticked so when Tolterodine modified-release is entered, Neditol XL, the MMT Formulary recommended product, does not appear at the top of the picking list.
